Continuation of 11. does NOT place the application in condition for allowance because: Applicant argues that Nelson does not disclose performing subpixel sampling using one of a plurality of multi-point sampling patterns, in dependence on which of said plurality of orientation classes that line falls into (see page 9 3rd paragraph of Applicant's Remarks). The Office points out that the already referenced sample-to-pixel calculation units of Nelson perform the subpixel sampling, converting sample values contained in memory to pixel values (see columns 21-22, lines 67-3). Further, Applicant argues that nowhere in Nelson is it disclosed that the sample patterns are based upon the classification of the line, X or Y Major (see pages 10-11 of Applicant's Arguments). The Office further points to columns 29-30, lines 26-32 in Nelson wherein Nelson further discloses the selecting of sampling points that lie within the calculated bounding rectangle. The interpretation of the Office in regards to the sample patterns being based upon the classification of the line can be seen in view of these lines in Nelson. Specifically, Nelson discloses calculating a normal distance to a sample in a certain direction, the direction based upon in which classification the line lies (see columns 29-30, lines 66-4 and column 30, lines 26-32). In other words the classification of the line determines the coordinates/location of the bounding box which in turn determines the manner in which the samples are selected, the manner also deciding what samples are selected. Even further, the Applicant argues that, "merely identifying the slope of the line does not teach or suggest the claimed step of identifying a direction to which that line is most nearly parallel," (see page 12 of Applicant's Remarks). The Office strongly disagrees with this statement as it is known in the art that the closer a value of slope is equivalent to 0, the closer the line will be representative as horizontal. Therefore, by Nelson calculating the slope of the, Nelson therefore inherently determines in which direction horizontal or vertical the line is more parallel to .
